

Transport of Dirac Fermions in Presence of Spin-orbit Impurities

P.Adroguer, E. Hankiewicz

Institute for theoretical physics, Universität Würzburg

In collaboration with :
D. Culcer and W. Liu (University of New South Wales)

DPG Frühjahrstagung 2014, Dresden

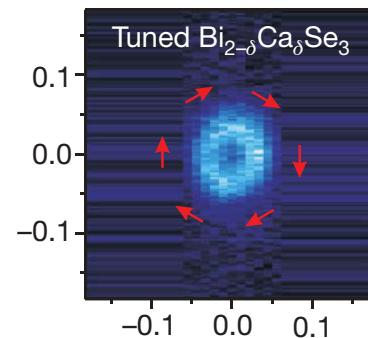

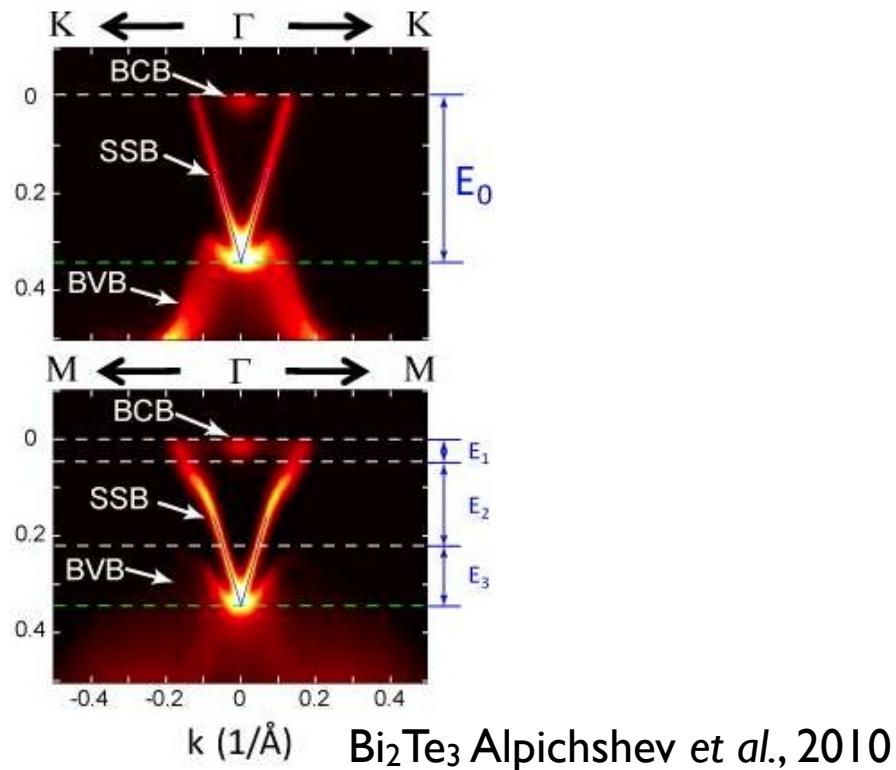

Outline

- Introduction to transport in 3D topological insulators
 - 3DTI surface states and transport
 - Regime of coherent transport (weak localization)
- Effects of spin-orbit impurities in 3DTI
 - Elastic scattering time
 - Diffusion constant
 - Quantum correction to conductivity
- Perspectives

3D Topological insulators surface states

- 3DTI : insulator with odd number of topologically protected surface states (Bi_2Te_3 , Bi_2Se_3 , strained HgTe...)

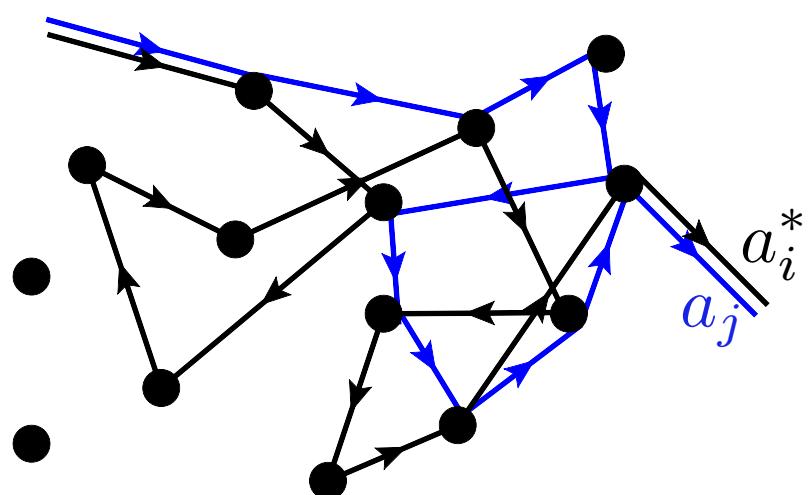

D. Hsieh et al., 2009

- Strong spin-orbit coupling : Spin-momentum locking
- Dirac fermions Hamiltonian : $\mathcal{H} = \hbar v_F (\vec{k} \times \vec{\sigma})_z$

Transport in mesoscopic physics

- Mesoscopic physics = weak disorder, coherent transport $\lambda_F \ll l_e \ll L, L_\phi$
- Scattering of the electrons on impurities
- Each trajectory has a given probability amplitude a_i
- Conductivity $\sigma \propto \sum_{i,j} a_i^* a_j$

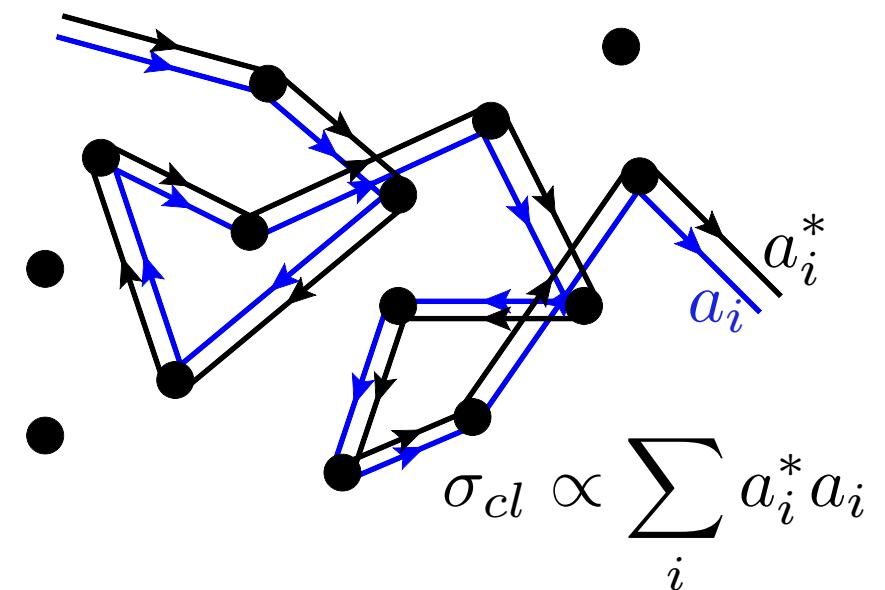

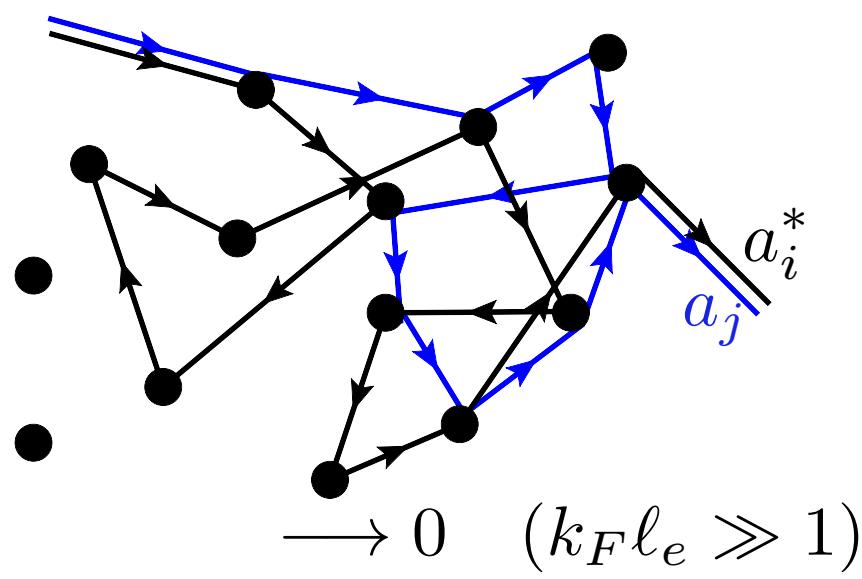

Transport in mesoscopic physics

- Mesoscopic physics = weak disorder, coherent transport
- Scattering of the electrons on impurities
- Each trajectory has a given probability amplitude a_i

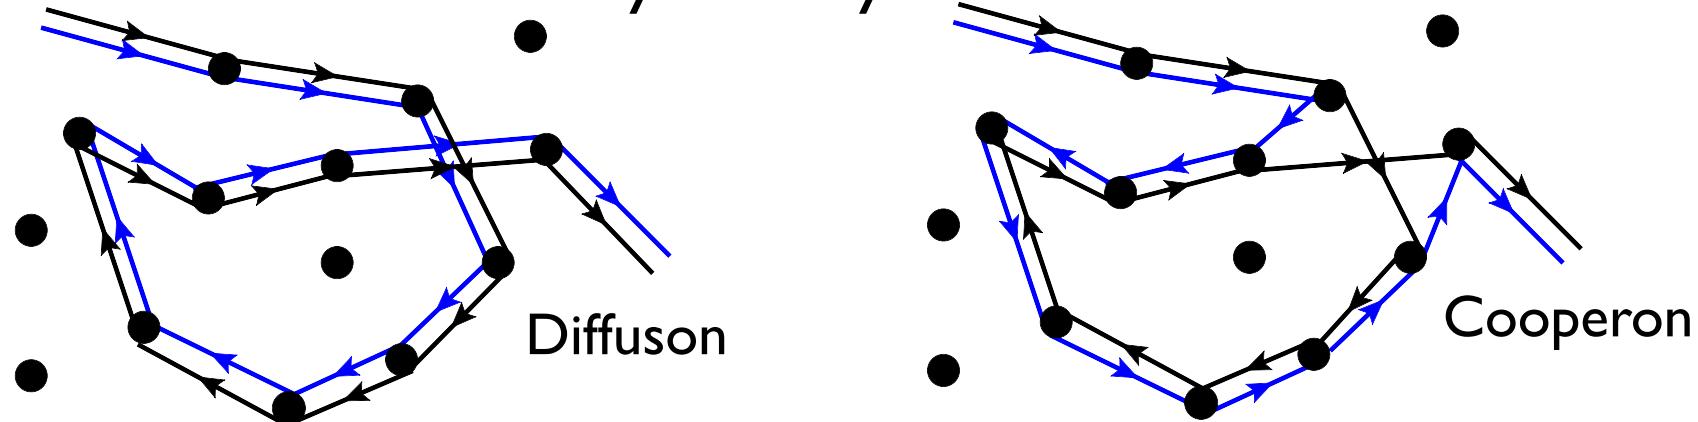

$$\lambda_F \ll l_e \ll L, L_\phi$$

- Conductivity $\sigma \propto \sum_{i,j} a_i^* a_j$

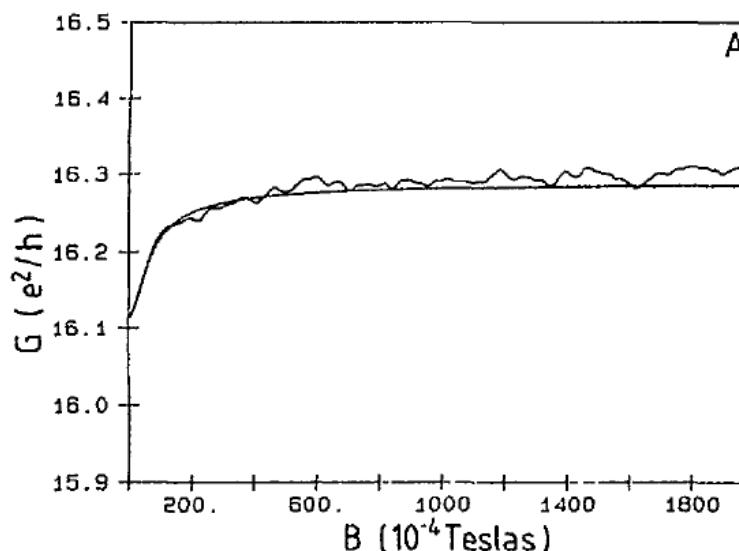

Quantum corrections to conductivity

- In case of time-reversal symmetry : added contribution

- Constructive interference suppressed by magnetic field : Weak localization (Altshuler et al., 1980)

Weak anti-localization

- In presence of spin orbit impurities (Hikami *et al.*, 1980)

$$V(\vec{k}, \vec{k}') = U(Id + i\lambda(\vec{k} \times \vec{k}').\vec{\sigma})$$

- Elastic scattering time modification

$$\frac{1}{\tau_e} = 2\pi\rho(E_F)n_IU^2(1 + \lambda^2k_F^4)$$

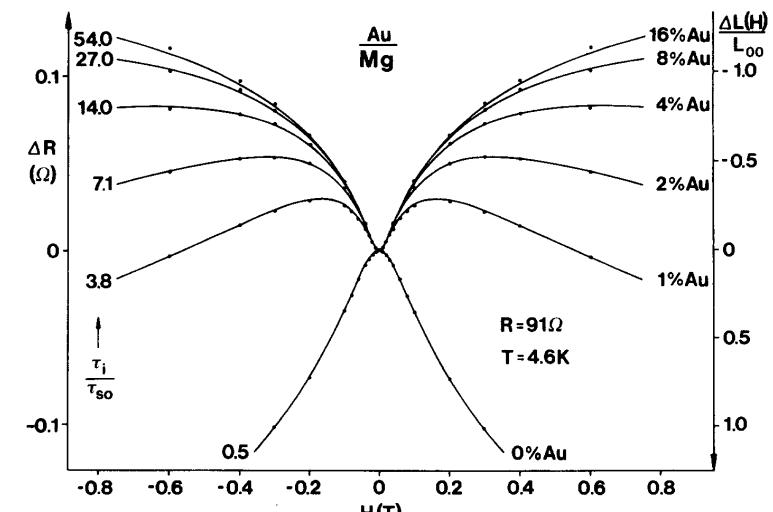

- Quantum correction to conductivity : $\sigma = \sigma_{cl} - \frac{\alpha e^2}{\pi^2\hbar} \ln L$

2 spin 1/2 : 4 cooperon modes

- 3 triplet (+1/2, killed)

- 1 singlet (-1/2, preserved)

$$\alpha : 1 \rightarrow -1/2$$

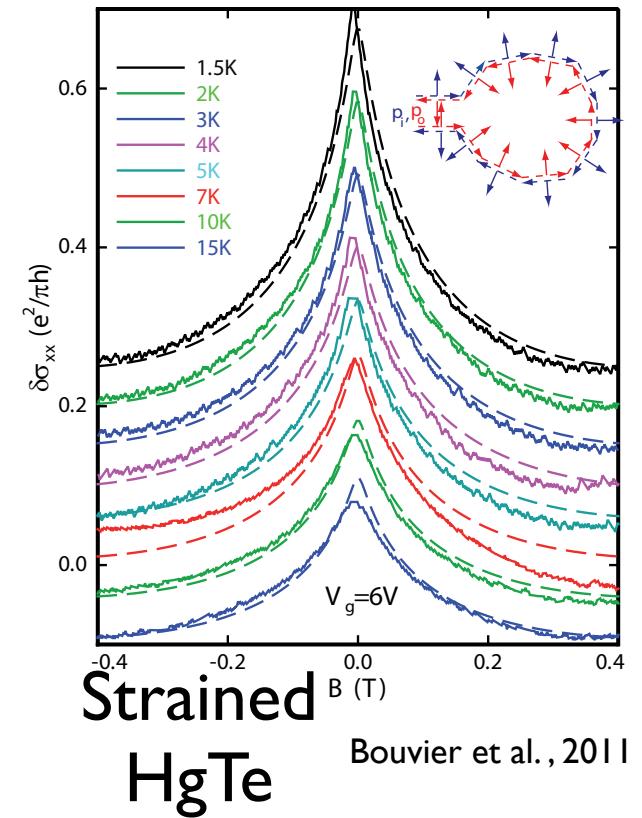

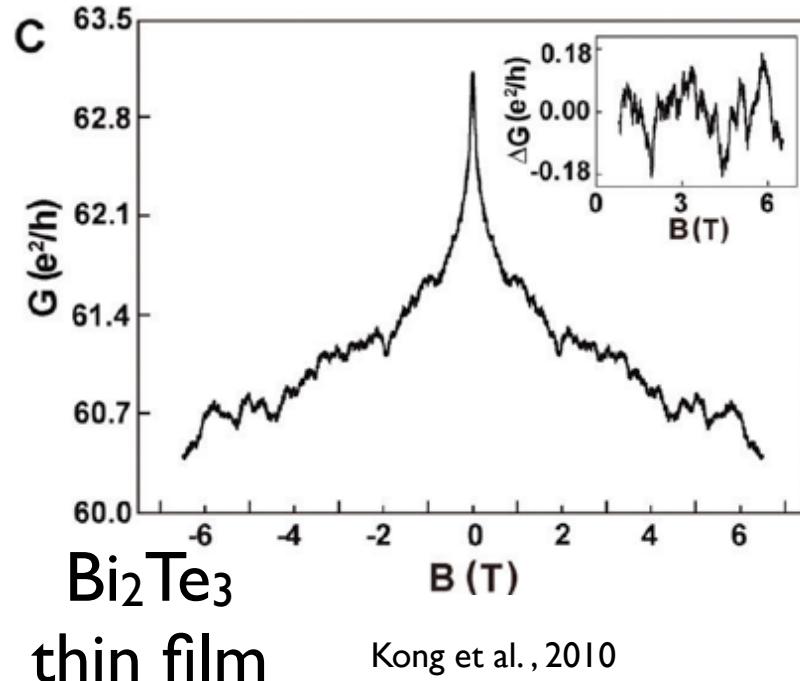

WL to WAL correction induced by SOC from impurities for a 2DEG with parabolic dispersion

Weak anti-localization!

Coherent transport of Dirac fermions

- Dirac fermions + scalar disorder : weak anti-localization

th : Tkachov and Hankiewicz, PRB 84 (2011)
Adroguer et al., NJP 14 (2012)

- What is the effect of the spin-orbit impurities on the Dirac fermions physics?

Outline

- Introduction to transport in 3D topological insulators
 - 3DTI surface states and transport
 - Regime of coherent transport (weak localization)
- Effects of spin-orbit impurities in 3DTI
 - Elastic scattering time
 - Diffusion constant
 - Quantum correction to conductivity
- Perspectives

Elastic scattering time

- Model : Dirac fermions + weak scalar disorder + SOC from impurities

$$\mathcal{H} = \hbar v_F (\vec{k} \times \vec{\sigma})_z + V(\vec{k}, \vec{k}')$$

$$V(\vec{k}, \vec{k}') = U(Id + i\lambda(\vec{k} \times \vec{k}').\vec{\sigma})$$

- Elastic scattering time via Fermi golden rule

$$\frac{1}{\tau_e} = \pi \rho(E_F) n_I U^2 \left(1 + \lambda k_F^2 + \frac{\lambda^2 k_F^4}{2} \right)$$

- Self energy calculation

$$\frac{1}{\tau_e} = \pi \rho(E_F) n_I U^2 \left(1 + \lambda k_F^2 + \frac{\lambda^2 k_F^4}{2} \right)$$

- New : Linear dependance in λ of the elastic scattering time!

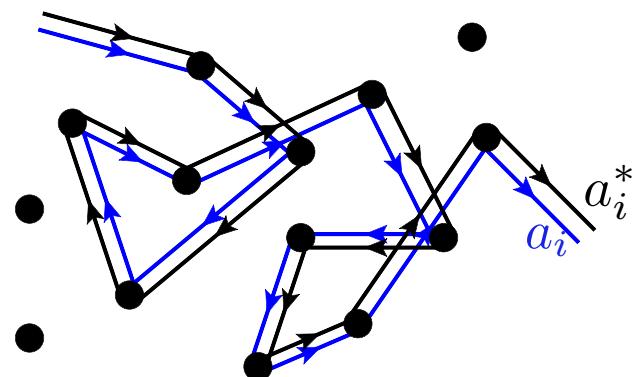

Diffusion constant $\sigma = e^2 \rho(E_F) D$

- Solving the kinetic equation

$$-e\vec{E} \cdot \vec{\nabla}_{\vec{k}} f = \int \frac{d\vec{k}'}{(2\pi)^2} 2\pi |\langle \vec{k}' | V | \vec{k} \rangle|^2 \delta(E(\vec{k}') - E(\vec{k}))(f(\vec{k}') - f(\vec{k}))$$

$$\sigma_{cl} = e^2 \rho(E_F) v_f^2 \tau_e (1 - \lambda k_F^2 + o(\lambda))$$

- Standard diagrammatic technique (ladder diagram)

$$\Gamma_{\alpha\beta\gamma\delta}^D(q) = \begin{array}{|c|} \hline \alpha & \beta \\ \hline & \cdot \\ \hline \gamma & \delta \\ \hline \end{array}$$

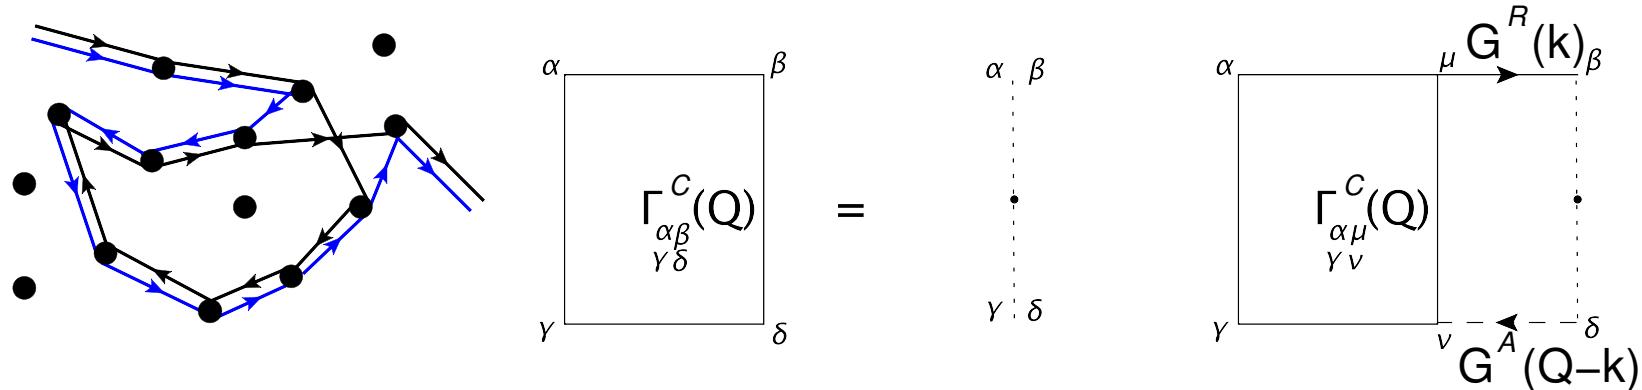

$$\begin{array}{|c|} \hline \alpha & \beta \\ \hline & \cdot \\ \hline \gamma & \delta \\ \hline \end{array} = \begin{array}{|c|} \hline \alpha & \beta \\ \hline & \cdot \\ \hline \gamma & \delta \\ \hline \end{array} + \begin{array}{|c|} \hline \alpha & \beta \\ \hline & \cdot \\ \hline \gamma & \delta \\ \hline \end{array} G_{\mu\nu}^R(k) + \begin{array}{|c|} \hline \alpha & \beta \\ \hline & \cdot \\ \hline \gamma & \delta \\ \hline \end{array} G_{\kappa\lambda}^A(k-q) G_{\mu\nu}^R(k)$$

$$\sigma_{cl} = e^2 \rho(E_F) v_f^2 \tau_e (1 - \lambda k_F^2 + o(\lambda))$$

- New : Dependence of the diffusion constant on λ !

Quantum correction to conductivity

- Cooperon structure factor

- 1 singlet mode and 3 triplets : one single diffusive (gapless) mode

$$\Gamma_{s.s.}^C(\vec{Q}) = \frac{1}{DQ^2} |S\rangle\langle S|$$

$$\Gamma_{t.s.}^C(\vec{Q}) = \frac{1}{DQ^2 + m_i} |T_i\rangle\langle T_i|$$

- Weak anti-localization expected!

Conclusions and perspectives

- Linear dependence in λ of the elastic scattering time
 - Diffusion constant dependence in λ
 - Weak anti-localization preserved
-
- 2nd order in λ for diffusion constant
 - Derivation of the quantum correction to conductivity :
 - Characteristic mag. field
 - Extra contributions from triplet states of cooperon
